I was in charge of creating the MerkleManager and MerkleThread classes. Though, also on my own, I wanted to create the remainder of the classes for my own benefit. There were no real challenges for me, but I found the project overall to be quite interesting. If I had to figure out the hashing code, I might have a different opinion though. I have previously never had any experience with multithreading, and was extremely excited to tackle that problem. It turned out much easier than I had imagined, though I can see where things can easily ramp up in difficulty. Going forward, I might tackle any group projects a little differently. I had set up a GitHub repo to store the code, but was the only one able to modify the code. Next time, I will add all the group members as collaborators so Git functions as it should.
